Fundamentals of Semiconductor Devices

A semiconductor material has an electrical conductivity value falling between that of a conductor, such as metallic copper, and an insulator, such as glass. Its resistance falls as its temperature rises; metals are the opposite. Its conducting properties may be altered in useful ways by introducing impurities ("doping") into the crystal structure. When two differently-doped regions exist in the ...

Semiconductor-based SGs represent another category of contact devices for embedded structural monitoring applications. The sensors typically have a thin rectangular form, with a thickness of about 10 mm. The fiber-like form and material similarity to glass fibres make these transducers appealing to composite control.
