Thermodynamics of Surfaces and Interfaces by Gerald H. Meier

The book begins with a review of the relevant aspects of the thermodynamics of bulk systems, followed by a description of the thermodynamic variables for surfaces and interfaces. Important surface phenomena are detailed, including wetting, crystalline systems (including grain boundaries), interfaces between different phases, curved interfaces (capillarity), adsorption phenomena and adhesion of surface layers.

Thermodynamics of Surfaces • Surface atoms are very different from atoms in the bulk. • The fewer neighbors of the surface cause it to have a very different and anisotropic chemical environment compared with the bulk. • The thermodynamics of the surface is most likely to be quite different from the thermodynamic properties of the bulk.

Thermodynamics of Surfaces and Interfaces

An interface constitutes the separation surface between two phases. A phase constitutes a homogeneous part of a thermodynamic system, i.e., the part of the universe that is under investigation. The system has always to be defined by the investigator before she/he starts to perform some studies.

Surface tension is defined as the intensity of the molecular attraction per unit length along any line in the surface of the fluid in contact with some external interface, or thermodynamically, it can be understood to be the change in Helmholtz free energy per unit area change as the droplet forms (or spreads out) over a surface.
